

M. HASEEB FARRUKH

Cloud DevOps Engineer

Pakistan 74600 | 03342708712

haseebfarrukh101@gmail.com | <https://www.linkedin.com/in/haseeb-farrukh-96b879181/>

PROFESSIONAL SUMMARY

Cloud DevOps Engineer with hands-on experience across 5+ production projects spanning Kubernetes orchestration, AWS cloud infrastructure, and end-to-end CI/CD automation. Proven expertise in designing resilient, scalable systems using Infrastructure as Code (Terraform), implementing GitOps workflows with Argo CD, and building comprehensive observability solutions with Prometheus and Grafana. Skilled at optimizing Docker image builds, managing multi-node bare-metal Kubernetes clusters, provisioning cloud resources, and automating deployment pipelines. Focused on reducing operational overhead, improving deployment reliability, and enabling teams to ship code with confidence.

TECHNICAL SKILLS

Cloud & Infrastructure: AWS (EKS, EC2, RDS, S3, Lambda, VPC, ALB, CloudWatch, IAM, CloudFormation, Event Bridge, Route 53)

Kubernetes & Containers: Kubernetes (taints/tolerations, Stateful Sets, HPA, RBAC, resource quotas), Docker, Helm, container security

CI/CD & Automation: Argo CD (GitOps, App of Apps), Jenkins, GitHub Actions, GitLab CI/CD, blue-green deployments

Infrastructure as Code: Terraform (AWS provisioning, VPC design, IAM), CloudFormation, Kubernetes manifests.

Observability & Logging: Prometheus, Grafana, Alert Manager, CloudWatch, ELK stack, log aggregation

DevSecOps & Security: RBAC, network policies, secrets management, container scanning (Trivy), SonarQube.

Programming & Scripting: Python, Go, Bash, SQL, Git

Core Competencies: Microservices, disaster recovery, cost optimization, performance tuning

WORK EXPERIENCE

Associate Cloud DevOps Engineer | QBS Co, Pakistan

November 2025 - Present

- Designed and maintained production Kubernetes manifests orchestrating frontend, backend, and PostgreSQL services in a microservices architecture; implemented resource limits, health probes, and rolling update strategies to enable zero-downtime deployments.
- Engineered GitOps workflows using Argo CD with automated multi-environment synchronization (dev, staging, prod) from Git repositories; reduced manual deployment errors by 85% and deployment time from 2 hours to 15 minutes through continuous synchronization.
- Engineered a multi-node bare-metal Kubernetes cluster with NVIDIA GPU support, using taints/tolerations to isolate GPU-intensive AI workloads from standard services; optimized Pod resource allocation to maximize utilization.
- Provisioned AWS cloud infrastructure via Terraform, designing a VPC architecture with segmented public/private subnets, routing tables, an Internet Gateway, a NAT Gateway, EC2 instances, and S3 buckets for production deployments.
- Developed a Go-based Docker image optimization utility that reduced AI workload image build times by 40%, accelerating CI pipeline execution and reducing container registry storage costs.
- Implemented end-to-end CI/CD automation integrating AWS ECR, Event Bridge, Lambda, and Jenkins. Automated Docker image builds, tests, tagging, and Kubernetes deployments with rollback on pipeline failures.
- Optimized Docker Compose configurations for internal and staging environments, improving developer efficiency with standardized multi-container setups, volume management, and networking strategies.
- Implemented an automated PostgreSQL backup pipeline with scheduled snapshots transferred to S3, enabling disaster recovery and data durability across failure scenarios.
- Deployed a production-grade Prometheus monitoring stack with custom scrape configs, Service Monitors, and alerting rules, providing infrastructure metrics, service observability, and proactive alerts to operations teams.
- Automated SSL certificate lifecycle management and service reload via Bash scripting, maintaining continuous HTTPS access and eliminating manual certificate renewal overhead.
- Also performed multiple database backups while setting read only replica-set for those databases. Also took backups dumps and upload it on s3 Storage service.

Automation DevOps Engineer | Rayan Technologies, Pakistan

November 2023 – August 2025

- Automated backend workflows with UiPath-Studio, Python, API integrations, and scripted logic, reducing manual task overhead by 70%. Enabled consistent, reliable processing across development and production environments.
- Containerized automation components using Docker to standardize execution, simplify deployments, and enhance portability across development and production systems.
- Established monitoring and log collection methods for automation jobs using CloudWatch-style logging principles, improving incident detection and troubleshooting speed.
- Developed Git-based version control workflows with branching, pull requests, and structured releases, supporting cleaner deployments and better CI/CD alignment.
- Designed reusable automation modules and configuration templates following IaC practices, making workflows easier to scale, update, and audit.
- Integrated validation, error handling, and notification hooks to improve reliability, minimize failed runs, and ensure smoother end-to-end process execution.

PROJECTS

Ajeek AWS Production Deployment

Portfolio: ajeeknow.com

- Launched production application on Amazon EKS with worker nodes provisioned on t3.large EC2 instances to achieve a high-availability architecture.
- Designed AWS VPC architecture with multi-tier subnets (public/private), routing tables, Internet Gateway for external access, and NAT Gateway for secure egress.
- Integrated AWS EFS for persistent storage across containerized services, enabling consistent data access for stateful workloads.
- Deployed Application Load Balancer (ALB) for secure external traffic routing with SSL/TLS termination and path-based routing rules.

NeuConnect & WaslHub Microservices Platform

- Architected microservices-based Kubernetes environment with PostgreSQL deployed as Stateful Sets for persistence, reliability, and ordered pod initialization.
- Managed frontend and API services through Deployments with horizontal pod autoscaling, ensuring application availability and graceful load distribution.
- Configured NGINX Ingress controller with TLS encryption for secure external traffic routing and domain-based service routing.
- Integrated Min.io on-premises object storage for backup efficiency and invoicing workflows, reducing dependency on external cloud storage.

CI/CD Pipeline with Jenkins and Argo CD.

- Engineered an end-to-end CI/CD pipeline automating 95%+ of deployment processes, reduced human deployment errors by 80%, and decreased production incidents by 50% through infrastructure automation.
- Integrated Jenkins as CI orchestrator with Argo CD as GitOps CD engine and achieved consistent repeatable deployments across 3+ environments with complete monitoring.

EDUCATION

Muhammad Ali Jinnah University

Feb 2019 - Feb 2023

Bachelor of Science | Computer Science (3.3 CGPA)

CERTIFICATIONS

- **Certified Kubernetes Administrator (CKA) - KodeKloud**
 - <https://learn.kodekloud.com/certificate/b37d5647-e3b5-480a-ade1-a0891a8b6f3b>
